

## Brainstorming & Idea Prioritization Template

|                      |               |
|----------------------|---------------|
| <b>Date</b>          | 30 March 2026 |
| <b>Team ID</b>       |               |
| <b>Project Name</b>  | Rising Waters |
| <b>Maximum Marks</b> | 3 Marks       |

### Step 1: Brainstorm and Idea Listing

Each team member lists out as many ideas as possible without judging them at this stage.

| S.No | Team Member          | Idea / Suggestion                                                                                                                   | Category                 | Group No. |
|------|----------------------|-------------------------------------------------------------------------------------------------------------------------------------|--------------------------|-----------|
| 1    | Telugu Ganesh        | Develop a Machine Learning model (Random Forest/XGBoost) to predict flood risk using rainfall, river water level, and weather data. | Core Predictive Modeling | 1         |
| 2    | Adimulipu Anil kumar | Build a user-friendly web application where users can check real-time flood alerts, rainfall data, and flood-prone areas.           | Frontend & UX            | 2         |

|   |                       |                                                                                                                                                         |                         |   |
|---|-----------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------|---|
| 3 | <b>Asia kakravada</b> | Integrate real-time weather forecasts and water-level sensor data to improve flood prediction accuracy and provide early warnings.                      | Risk Assessment Feature | 1 |
| 4 | <b>Akhil kontham</b>  | Create an Admin Dashboard for disaster management authorities to monitor flood levels, manage alerts, visualize affected regions, and generate reports. | Admin Analytics         | 3 |
| 5 | <b>P vaahid</b>       | Implement an AI chatbot that provides flood safety guidelines, emergency contacts, evacuation routes, and answers user queries during emergencies.      | Customer Support        | 4 |

## Step 2: Idea Prioritization

Rate each grouped idea on feasibility and importance, then select the final idea(s) to move forward with.

| Group No. | Final Idea                                                                                                                                                                    | Feasibility<br>(High/Medium/Low) | Importance<br>(High/Medium/Low) | Priority | Selected<br>(Yes/No) |
|-----------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------|---------------------------------|----------|----------------------|
| 1         | <b>AI-Based Flood Prediction &amp; Early Warning System:</b> Use Machine Learning with rainfall, weather, and river-level data to predict flood risks and issue early alerts. | High                             | High                            | 1        | Yes                  |
| 2         | <b>Secure Web Application:</b> Interactive platform showing flood forecasts, live alerts, safe zones, and emergency information for users.                                    | High                             | High                            | 2        | Yes                  |

|   |                                                                                                                                                                     |        |      |   |     |
|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|------|---|-----|
| 3 | <b>Disaster Management Dashboard:</b><br>Dashboard for authorities to monitor flood-prone regions, analyze data, manage alerts, and coordinate emergency responses. | Medium | High | 3 | Yes |
|---|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|------|---|-----|
